

Recount Text

My experience working on the collaborative project in semester 2 was quite challenging because this time we had to do it individually. It was different from the semester 1 project, where we worked in groups and could collaborate with each other.

In this collaborative project, there were three stages. The first stage was designing the UI/UX landing page and creating the concept for the IPAS poster. The second stage included developing a responsive website, integrating English content, presenting mathematical data using a progress bar, and creating a project documentation video for Informatics class.

The final stage, or stage three, involved demonstrating the website code and content, giving the final IPAS presentation, and doing a client negotiation simulation for the Indonesian language subject. The most enjoyable part was designing, while the most difficult part was coding, because even a small mistake could cause the results to not match expectations.
